<b>Description</b> 5 -Failed Defences Against Application Misuse CWE : CWE-841 Description : The misuse and invalid use of valid functionality can identify attacks attempting to enumerate the web application, identify weaknesses, and exploit vulnerabilities. Tests should be undertaken to determine whether there are application-layer defensive mechanisms in place to protect the application. Affected Path(s) : <a href="https://earogya.satragroup.in/change-password">https://earogya.satragroup.in/change-password</a> *-Applicable to entire application Impact : The lack of active defences allows an attacker to hunt for vulnerabilities without any recourse. The application’s owner will thus not know their application is under attack. Recommendation : Build inactive defences against application misuse. It is also recommended to implement strong server side controls in such a way that same request cannot be submitted multiple times. Evidence/Proof Of Concept : Step 1: Login to the application and submit change-password record and submit the record.Again submit the same request multiple times. It was observed that the server accepts it.
